## CYCLOHEXYL AMINE DERIVATIVES AND THEIR USE AS TACHYKININ ANTAGONISTS

5 This invention relates to a class of cyclic compounds, which are useful as tachykinin antagonists. More particularly, the compounds of the invention comprise a cyclohexyl ring system substituted by an arylmethoxy or arylmethylthio moiety, phenyl and an optionally substituted amino group.

10 The tachykinins are a group of naturally-occurring peptides found widely distributed throughout mammalian tissues, both within the central nervous system and in the peripheral nervous and circulatory systems. The three known mammalian tachykinins are:  
15 substance P, neurokinin A and neurokinin B:

Evidence for the usefulness of tachykinin receptor antagonists in pain, headache, especially migraine, Alzheimer's disease, multiple sclerosis, attenuation of morphine withdrawal, cardiovascular changes, oedema, such as oedema caused by thermal injury, chronic inflammatory diseases such as rheumatoid arthritis, asthma/bronchial hyperreactivity and other respiratory diseases including allergic rhinitis, inflammatory diseases of the gut including ulcerative colitis and Crohn disease, ocular injury and ocular  
20 inflammatory diseases, proliferative vitreoretinopathy, irritable bowel syndrome and disorders of bladder function including cystitis and bladder detruser hyper-reflexia is reviewed in "Tachykinin Receptors and  
25 Tachykinin Receptor Antagonists", C.A. Maggi, R. Patacchini, P. Rovero and A. Giachetti, J. Auton. Pharmacol. (1993) 13, 23-93. Tachykinin antagonists are also believed to be useful in allergic conditions  
30 [Hamelet et al Can. J. Pharmacol. Physiol. (1988) 66

- 2 -

1361-7], immunoregulation [Lotz et al Science (1988) 241  
1218-21 and Kimball et al, J. Immunol. (1988) 141 (10)  
3564-9], and as anticonvulsants [Garant et al., Brain  
Research (1986) 382 372-8]. Tachykinin antagonists may  
5 also be useful in the treatment of small cell carcinomas,  
in particular small cell lung cancer (SCLC) [Langdon et  
al., Cancer Research (1992) 52, 4554-7].

It has furthermore been suggested that  
tachykinins have utility in the following disorders:  
10 depression, dysthymic disorders, chronic obstructive  
airways disease, hypersensitivity disorders such as  
poison ivy, vasospastic diseases such as angina and  
Reynauld's disease, fibrosing and collagen diseases such  
as scleroderma and eosinophilic fascioliasis, reflex  
15 sympathetic dystrophy such as shoulder/hand syndrome,  
addiction disorders such as alcoholism, stress related  
somatic disorders, neuropathy, neuralgia, disorders  
related to immune enhancement or suppression such as  
systemic lupus erythmatosis (European patent application  
20 no. 0 436 334), conjunctivitis, vernal conjunctivitis,  
contact dermatitis, atropic dermatitis, urticaria, and  
other eczematoid dermatitis (European patent application  
no. 0 394 989) and emesis (European patent application  
no. 0 533 280).

25 We have now found a class of non-peptides which  
are potent antagonists of tachykinin.

European patent application no. 0 436 334  
discloses 4- to 7-membered azacyclic compounds  
substituted at the 3-position by a benzyl substituted  
30 amino moiety and at the 2-position by an aryl moiety.  
The compounds are said to be tachykinin antagonists.

The present invention provides a compound of  
formula (I), or a salt or prodrug thereof:

The substance P antagonising activity of the compounds described herein was evaluated using the human NK1R assay described in published European patent

- 7 -

application no. 0 528 495. The method essentially involves determining the concentration of the test compound required to reduce by 50% the amount of radiolabelled substance P binding to human NK1R, thereby  
5 affording an IC<sub>50</sub> value for the test compound. The compounds of Examples 1, 5 and 6 were found to have IC<sub>50</sub> values of 100nM, 350nM and 100nM, respectively.

The invention also provides pharmaceutical compositions comprising one or more compounds of this  
10 invention in association with a pharmaceutically acceptable carrier. Preferably these compositions are in unit dosage forms such as tablets, pills, capsules, powders, granules, solutions or suspensions, or suppositories, for oral, parenteral or rectal  
15 administration, or topical administration including administration by inhalation or insufflation.

The invention further provides a process for the preparation of a pharmaceutical composition comprising a compound of formula (I), or a salt or  
20 prodrug thereof, and a pharmaceutically acceptable carrier, which process comprises bringing a compound of formula (I), or a salt or prodrug thereof into association with a pharmaceutically acceptable carrier.

For preparing solid compositions such as  
25 tablets, the principal active ingredient is mixed with a pharmaceutical carrier, e.g. conventional tableting ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate, dicalcium phosphate or gums, and other  
30 pharmaceutical diluents, e.g. water, to form a solid preformulation composition containing a homogeneous mixture of a compound of the present invention, or a non-toxic pharmaceutically acceptable salt thereof. When referring to these preformulation compositions as

- 8 -

homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This solid preformulation composition is then subdivided into unit dosage forms of the type described above containing from 0.1 to about 500 mg of the active ingredient of the present invention. The tablets or pills of the novel composition can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in the stomach and permits the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol and cellulose acetate.

The liquid forms in which the novel compositions of the present invention may be incorporated for administration orally or by injection include aqueous solutions, suitably flavoured syrups, aqueous or oil suspensions, and flavoured emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil or peanut oil, as well as elixirs and similar pharmaceutical vehicles. Suitable dispersing or suspending agents for aqueous suspensions include synthetic and natural gums such as tragacanth, acacia, alginate, dextran, sodium carboxymethylcellulose, methylcellulose, polyvinylpyrrolidone or gelatin.

- 9 -

Compositions for inhalation or insufflation include solutions and suspensions in pharmaceutically acceptable, aqueous or organic solvents, or mixtures thereof, and powders. The liquid or solid compositions may contain suitable pharmaceutically acceptable excipients as set out above. Preferably the compositions are administered by the oral or nasal respiratory route for local or systemic effect. Compositions in preferably sterile pharmaceutically acceptable solvents may be nebulised by use of inert gases. Nebulised solutions may be breathed directly from the nebulising device or the nebulising device may be attached to a face mask, tent or intermittent positive pressure breathing machine. Solution, suspension or powder compositions may be administered, preferably orally or nasally, from devices which deliver the formulation in an appropriate manner.

For topical administration, for example as a cream, ointment or lotion, pharmaceutically acceptable carriers are, for example, water, mixtures of water and water-miscible solvents such as lower alkanols or arylalkanols, vegetable oils, polyalkylene glycols, petroleum based jelly, ethyl cellulose, ethyl oleate, carboxymethylcellulose, polyvinylpyrrolidone, isopropyl myristate and other conventionally-employed non-toxic, pharmaceutically acceptable organic and inorganic carriers. The pharmaceutical preparation may also contain non-toxic auxiliary substances such as emulsifying, preserving, wetting agents, bodying agents and the like, as for example, polyethylene glycols 200, 300, 400 and 600, carbowaxes 1,000, 1,500, 4,000, 6,000 and 10,000, antibacterial components such as quaternary ammonium compounds, phenylmercuric salts known to have cold sterilizing properties and which are non-injurious in use, thimerosal, methyl and propyl paraben, benzyl

- 10 -

alcohol, phenyl ethanol, buffering ingredients such as sodium chloride, sodium borate, sodium acetates, gluconate buffers, and other conventional ingredients such as sorbitan monolaurate, triethanolamine, oleate, polyoxyethylene sorbitan monopalmitate, dioctyl sodium sulfosuccinate, monothioglycerol, thiosorbitol, ethylenediamine tetraacetic acid, and the like.

According to a further or alternative aspect, the present invention provides a compound of formula (I) for use in the manufacture of a medicament for the

- 12 -

treatment of physiological disorders associated with an excess of tachykinins, especially substance P.

The present invention also provides a method for the treatment or prevention of physiological disorders associated with an excess of tachykinins, especially substance P, which method comprises administration to a patient in need thereof of a tachykinin reducing amount of a compound of formula (I) or a composition comprising a compound of formula (I).

The present invention also provides a composition comprising a compound of formula (I), a bronchodilator, and a pharmaceutically acceptable carrier.

In the treatment of the conditions associated with an excess of tachykinins, a suitable dosage level is about 0.001 to 50 mg/kg per day, in particular about 0.01 to about 25 mg/kg, such as from about 0.05 to about 10

- 13 -

mg/kg per day. For example, in the treatment of conditions involving the neurotransmission of pain sensations, a suitable dosage level is about 0.001 to 25 mg/kg per day, preferably about 0.005 to 10 mg/kg per day, and especially about 0.005 to 5 mg/kg per day. The compounds may be administered on a regimen of 1 to 4 times per day, preferably once or twice per day.

The compounds according to the invention wherein  $R^3$  and  $R^4$  both represent H may be prepared by a process which comprises treatment of an intermediate of formula (II):

(II)

wherein  $R^1$ ,  $R^5$ ,  $R^7$ ,  $R^8$  and X are as defined for formula (I) and  $R^{30}$  represents an alkyl or, preferably, a phenyl group, with a reagent of formula  $R^2$ -M, where  $R^2$  is as defined for formula (I) and M represents an alkali metal, such as lithium.

The reaction is conveniently effected in a suitable organic solvent, such as an ether, for example, tetrahydrofuran.

Compounds of formula (I) where one or both of  $R^3$  and  $R^4$  are other than H may be prepared from compounds of formula (I) wherein both of  $R^3$  and  $R^4$  represent H by conventional procedures, for example, reaction with a suitable alkylating or acylating agent. Suitable procedures are described in the accompanying examples,

- 14 -

and further procedures will be readily apparent to those skilled in the art.

Intermediates of formula (II) may be prepared from compounds of formula (III):

5

(III)

wherein  $R^1$ ,  $R^5$ ,  $R^7$ ,  $R^8$  and X are as defined for formula (I), by reaction with a compound of formula  $R^{30}-S-S-R^{30}$  in the presence of ammonia and a nitrite, such as, for example, silver nitrite.

15

30

Conveniently the oxidation is effected under Swern conditions, i.e. with the use of oxalyl chloride in the presence of dimethyl sulfoxide. Other suitable oxidation procedures will be readily apparent to those skilled in the art.

- 15 -

Compounds of formulae (VII) and (VIII) are commercially available or may be prepared from

- 16 -

commercially available starting materials by known procedures.

Where the above-described process for the preparation of the compounds according to the invention gives rise to mixtures of stereoisomers these isomers  
5 may, if desired, be separated, suitably by conventional techniques such as preparative chromatography.

During any of the above synthetic sequences it may be necessary and/or desirable to protect sensitive or reactive groups on any of the molecules concerned. This  
10 may be achieved by means of conventional protecting groups, such as those described in Protective Groups in Organic Chemistry, ed. J.F.W. McOmie, Plenum Press, 1973; and T.W. Greene and P.G.M. Wuts, Protective Groups in Organic Synthesis, John Wiley & Sons, 1991. The  
15 protecting groups may be removed at a convenient subsequent stage using methods known from the art.
